Test case: AL-151

Story: As an underwriter, I sign off an application and my decision is recorded

Tested by: Nikoloz Chilachava
Date run: 10 Nov 2026
Build: `feature/AL-165-sign-off-panel` at commit `4723898` (PR #189, open; review fix `e4a2dd9` pushed on 12 Nov)

Preconditions

- Firebase emulators started with the seed data from main's al-core (`firebase emulators:start --project demo-al --import=./seed-data` in `al-core`), and the portal running (`npm run dev` in `al-web`). Seeded logins use the demo password from `al-core/scripts/seed.js`.
- The al-core API running locally against the emulators.
- Signed in as uma@test.com (underwriter).

Steps

#	Criterion	Steps	Expected result	Automated check	Result
1	1	Open the loan file for `app-deliberated` (AI Deliberated).	The sign-off panel shows the committee's effective recommendation and offers Approve and Decline, with a required justification.	SignOffPanel.test.tsx, loan-file.test.tsx	[x] Pass [ ] Fail
2	2	Type a justification, choose Approve and confirm. Check the application in the Emulator UI.	The decision, the underwriter's ID, the time and the justification are saved, and the status moves to Underwriter Approved.	SignOffPanel.test.tsx, apiClient.test.ts	[x] Pass [ ] Fail
3	3	Open the same kind of file as a broker. Try to write a decision as a broker.	Brokers never see the sign-off controls, and a broker's decision write is refused (rules test).	loan-file.test.tsx, SignOffPanel.test.tsx; backend rules test (al-core)	[ ] Pass [ ] Fail
4	4	Choose the outcome that differs from the AI recommendation.	The form asks the underwriter to say why.	SignOffPanel.test.tsx, loan-file.test.tsx	[x] Pass [ ] Fail

Automated test run

al-web Vitest on `feature/AL-165-sign-off-panel` at `4723898`, 10 Nov 2026: **480 passed, 0 failed**. After the review fix `e4a2dd9`, 12 Nov 2026: **484 passed, 0 failed**. The build (`npm run build`: `tsc -b` then `vite build`) passed.

Notes

- Step 1: the panel showed the AI recommendation Approve as advice, a required justification and Approve and Decline.
- Step 2: the confirmation listed the application, borrower, outcome and justification. One `POST /core/applications/app-deliberated/decision` returned 200. Firestore saved status Underwriter Approved and `decision` with outcome approved, `underwriterId` underwriter1, `decidedAt` and `reason`, plus a `statusHistory` entry AI Deliberated to Underwriter Approved with actor underwriter. The page showed "Decision recorded: Approved. Saved status: Underwriter Approved." No console errors.
- Step 3: the broker never seeing the panel is unit tests only (loan-file.test.tsx, SignOffPanel.test.tsx). Not run yet by me: the rules test. Firestore has no write rule, so every write goes through the al-core API, which refuses a broker with 403; that test is al-core's.
- Step 4: unit tests only (SignOffPanel.test.tsx, loan-file.test.tsx). On an override the confirmation shows "You are going against the AI recommendation." The justification is required for every decision, not only an override.
- The sign-off changes the emulator data (`app-deliberated` stays Underwriter Approved). Re-import the seed data to reset it.
