Test case: AL-196

Story: As an underwriter, I review a HELOC application with its combined LTV and collateral value

Tested by: Nikoloz Chilachava
Date run: 29 Oct 2026 (step 1) and 10 Nov 2026 (steps 2 to 5)
Build: step 1 on the HELOC queue and collateral work merged into `main` on 30 Oct 2026 (PR #141); steps 2 to 5 on `feature/AL-213-heloc-policy-conditions` at commit `d5acc93` (PR #190, open)

Preconditions

- Firebase emulators started with the seed data from main's al-core (`firebase emulators:start --project demo-al --import=./seed-data` in `al-core`), and the portal running (`npm run dev` in `al-web`). Seeded logins use the demo password from `al-core/scripts/seed.js`.
- For step 5: the al-core API running locally against the emulators, and a local Hardhat node with the contracts deployed (`npm run deploy:local` in `al-core/chain`).
- Signed in as uma@test.com (underwriter). The seeded HELOC is `app-approved` (Ben Walsh, broker ciara@test.com).

Steps

#	Criterion	Steps	Expected result	Automated check	Result
1	1	Open the pipeline queue and set the loan type filter to HELOC.	Every row shows its loan type, and the filter shows only HELOC applications.	pipeline-queue.test.tsx	[x] Pass [ ] Fail
2	2	Open the loan file for `app-approved`.	The estimated value (indicative), the existing balance, the requested limit, combined LTV and the 80% cap, and no asking price comparison.	HelocCollateral.test.tsx, loan-file.test.tsx	[x] Pass [ ] Fail
3	3	On the same file, read the DTI breakdown and the Committee section.	Both work the same as for a mortgage.	loan-file.test.tsx, CommitteeConsole.test.tsx	[x] Pass [ ] Fail
4	4	Add `CLTV_CAP` to the review's stored breaches in the Emulator UI and reload.	The "requires lender exception review" condition shows clearly.	HelocCollateral.test.tsx	[x] Pass [ ] Fail

5	5	Sign off, mint and download the audit pack for the HELOC.	They work as for a mortgage and show the loan type.	SignOffPanel.test.tsx, loan-file.test.tsx, AuditPackActions.test.tsx, auditExports.test.ts	[ ] Pass [x] Fail

Automated test run

al-web Vitest on `feature/AL-213-heloc-policy-conditions` at `d5acc93`, 10 Nov 2026: **494 passed, 0 failed**. The build (`npm run build`: `tsc -b` then `vite build`) passed.

Notes

- Step 1: all 7 seeded applications showed a loan type, and the HELOC filter showed 1 of 7 (29 Oct).
- Step 2: estimated value €415,000 labelled "indicative estimate of a 2024 asking price, not a valuation", existing balance €180,000, credit limit €60,000, combined LTV 57.8% against the 80% cap. No asking price row. Conditions listed "Requires an independent surveyor's valuation (HELOC)".
- Step 3: the DTI breakdown showed 20.1% and 21%. The Committee section showed the HELOC's run with the same console as a mortgage; the console's own gaps are in the AL-30 test case.
- Step 4: with `CLTV_CAP` added by hand, "Requires lender exception review: the combined LTV is above the 80% cap (CLTV_CAP)." showed in the conditions.
- Step 5: the mint and the audit pack worked on this HELOC (AL-37 and AL-38 test cases: token id 2, and the CSV holds `loan_type heloc`). Sign-off uses the same panel as a mortgage; `app-approved` is already Underwriter Approved in the seed, so sign-off was not run on a HELOC in the browser. Fail: the Loan note card does not show the loan type yet.
- The emulator edits were made by hand. Re-import the seed data to reset them.
