Test case: AL-23

Story: As an underwriter, I compare the seller's asking price against the model's valuation

Tested by: Nikoloz Chilachava
Date run: 10 Nov 2026
Build: `feature/AL-155-collateral-panel` at commit `6515234` (PR #188, open)

Preconditions

- Firebase emulators started with the seed data from main's al-core (`firebase emulators:start --project demo-al --import=./seed-data` in `al-core`), and the portal running (`npm run dev` in `al-web`). Seeded logins use the demo password from `al-core/scripts/seed.js`.
- Signed in as uma@test.com (underwriter).

Steps

#	Criterion	Steps	Expected result	Automated check	Result
1	1	Open the loan file for `app-funded`, then for `app-deliberated` after setting its review's `priceNeedsReview` to true in the Emulator UI.	The collateral section shows the asking price, the model estimate and the signed gap as a percentage. The "Price needs review" badge shows only when the model flags it.	MortgageCollateral.test.tsx, loan-file.test.tsx	[x] Pass [ ] Fail
2	2	On the same two loan files, read the LTV rows.	Purchase-price LTV and indicative model-based LTV side by side, each against the 90% limit.	MortgageCollateral.test.tsx	[x] Pass [ ] Fail
3	3	On `app-funded`, read the label under the estimate and the area next to it.	The estimate is labelled as an estimate based on 2024 asking prices, with the low-support warning next to it.	MortgageCollateral.test.tsx	[x] Pass [ ] Fail

4	4	Compare the figures on every seeded mortgage application with its stored application and review documents in the Emulator UI.	Every value matches the stored record.	MortgageCollateral.test.tsx	[ ] Pass [ ] Fail

Automated test run

al-web Vitest on `feature/AL-155-collateral-panel` at `6515234`, 10 Nov 2026: **484 passed, 0 failed**. The build (`npm run build`: `tsc -b` then `vite build`) passed.

Notes

- Step 1: `app-funded` showed asking price €365,000, model estimate €366,000, Model v2, "Asking price 0.3% below the estimate" and no badge. `app-deliberated`, with `priceNeedsReview` set to true by hand, showed the "Price needs review" badge and "Asking price 1.3% above the estimate".
- Step 2: `app-funded` showed purchase-price LTV 79.5% and indicative LTV 79.2%; `app-deliberated` showed 85.5% and 86.6%. Both against the 90% limit.
- Step 3: the label reads "indicative estimate of a 2024 asking price, not a valuation", not the criterion's exact words. The support warning showed next to it on `app-funded`. `app-deliberated` has no warnings, and no warning area showed.
- Step 4: Not run yet: only `app-funded` and `app-deliberated` were compared in the browser. To run: open each of the other seeded mortgage applications and compare every figure with its stored record.
- The `priceNeedsReview` edit was made by hand in the Emulator UI. Re-import the seed data to reset it.
- No console errors during the run.
