Test case: AL-132

Story: As a borrower, I see how each detail of the house moved its estimated price

Tested by: Ibrahima Toure
Date run: 6 Nov 2026
Build: `main` at commit `66e32f0`

Preconditions

- Firebase emulators started with the seed data (`firebase emulators:start --project demo-al --import=./seed-data` in `al-core`), al-core and al-ai running locally, the app on the iPhone 17 simulator. Seeded logins use the demo password from `al-core/scripts/seed.js`.
- Signed in as alice@test.com. Open Check a property.

Steps

#	Criterion	Steps	Expected result	Automated check	Result
1	1	Check the reference property used in the AI tests.	Each detail's contribution in euro with a + or - sign, largest first.	ValuationBreakdownTests: TheLargestDetailComesFirstWhateverOrderTheyArriveIn, EachRowSaysWhichWayItMovedTheEstimate	[x] Pass [ ] Fail
2	2	Read the first row and add up the list.	Labelled "Starting point", never a typical price. Starting point plus contributions equals the estimate.	ValuationBreakdownTests: TheBaselineIsCalledTheStartingPointNeverATypicalPrice, RoundedRowsAreNudgedToAddUpToTheShownEstimate	[x] Pass [ ] Fail
3	3	Call /valuation with the same inputs and compare.	The same numbers as the response.	Manual comparison	[x] Pass [ ] Fail
4	4	Use a response with no breakdown (unit test fixture).	The section is hidden and the rest of the result still works.	ValuationBreakdownTests.HiddenWhenTheAnswerHasNoBreakdown, ValuationSummaryTests.WithoutABreakdownTheRestOfTheResultIsUnchanged	[x] Pass [ ] Fail

Automated test run

iOS unit tests (`AgenticLenderTests`) on `main` at `66e32f0`, iPhone 17 simulator (iOS 26.5), 6 Nov 2026: **651 passed, 0 failed, 0 skipped**. The UI tests named above (`AgenticLenderUITests`) need the emulators running and were not part of this run.

Notes

- Steps 1 and 2: on the AL-22 Cork check, the list starts at "Starting point €577,000, average of the model's sample homes" (not a typical price), then -93k, -93k, -90k, -30k, +13k, -11k, largest first, adding up to the €273,000 shown.
- Step 3: compared with POST /ai/valuation for the same inputs. Every row is within €1,000 of the response. Two rows differ from plain rounding: floor area -89,496 shows as -€90,000 and BER +13,601 as +€13,000. Plain rounding would add up to €275,000, so the app nudges the rows closest to the rounding line to make the list add up to the estimate (criterion 2, unit test RoundedRowsAreNudgedToAddUpToTheShownEstimate).
- Step 4: covered by the unit tests (HiddenWhenTheAnswerHasNoBreakdown, WithoutABreakdownTheRestOfTheResultIsUnchanged), which passed in the run above; the live endpoint always returns a breakdown, so it was not tried by hand.
